A Surprise.

"The doctor has just told me," said the friendly neighbor, "that your husband cannot recover."
"Oh!" shrieked the troubled wife.
"Now, my dear, the question is: shall we break the news to him or let death come as a surprise to him?"

Important to Mothers.
Examine carefully every bottle of CASTORIA, that famous old remedy for infants and children, and see that it bears the Signature of *Dr. J. C. Fletcher* In Use for Over 30 Years. Children Cry for Fletcher's Castoria

How He Got It.

"Who is that man?"
"He is a pacifist."
"Doesn't believe in fighting?"
"No."
"How did he get the blackeye?"
"Because he didn't believe in fighting."

Infections or inflammations of the Eyes, whether from external or internal causes, are promptly healed by the use of Roman Eye Balsam at night upon retiring. Adv.

Favored by Nature.

"That old horse seems to have a peculiar fascination for you."
"I can't help admiring him. He is one of the few who have free of cost all the leather they can possibly use."

**With the Fingers!
Says Corns Lift Out
Without Any Pain**

Sore corns, hard corns, soft corns or any kind of a corn can shortly be lifted right out with the fingers if you will apply on the corn a few drops of freezone, says a Cincinnati authority. At little cost one can get a small bottle of freezone at any drug store, which will positively rid one's feet of every corn or callus without pain or soreness or the danger of infection.

This new drug is an ether compound, and dries the moment it is applied and does not inflame or even irritate the surrounding skin. Just think! You can lift out your corns and calluses now without a bit of pain or soreness. If your druggist hasn't freezone he can easily get a small bottle for you from his wholesale drug house.—adv.

Her Hands Full.

"Are you affiliated with any reform organization?"
"Yes, I'm a wife."

Contrary Compensation.

"This is an ugly matter."
"Yes, but somebody will have to pay handsomely for it."

Annual Flowering Plants

By L. C. CORBETT
Horticulturist, Bureau of Plant Industry
U. S. Department of Agriculture

CAMPANULA

(Canterbury Bells, Bell Flower, Slipperwort)

Campanula is a genus comprising both perennial, biennial, and annual flowering plants. These fine old plants are rich in color, profuse in bloom, and of easy culture. For outdoor effects, when planted in quantity, they are glorious, and finest full-blown specimens of such varieties as cal-

Campanula.

canthemum or Canterbury bells can be transplanted to pots for house decoration by soaking the soil about them with water and lifting with a ball of earth. The seeds of the annuals should be sown in April or early in May. The seeds of biennials should be sown outdoors early in July, and the plants may be thinned or transplanted to temporary quarters as late as October.

The old practice of covering Canterbury bells with leaves through the winter is not satisfactory. Transplant them 6 or 8 inches apart in a cold frame, where they will make large plants by spring and are as easily cared for as pansies. In the spring set them 18 to 20 inches apart in beds where they are to bloom. In June and July they flower most profusely, and are in fine form a long time. They also make beautiful pot plants for Easter. If sown early in good soil the hardy perennials will bloom early the next year. All varieties like a rich, sandy soil, with good drainage.

NEMOPHILA

The representatives of the genus nemophila are dwarf, compact-growing, hardy, annual herbs, which produce an abundance of showy bell-shaped flowers from early spring to late autumn, for which reason they are esteemed for borders and for bedding purposes. All the species may be propagated from seed. If the seeds are sown in the open about the middle of August and then transplanted in

Nemophila.

late autumn very early flowers may be obtained. For summer and late fall blooms the seed may be sown in the open in April and not transplanted. The nemophilas love a moist loam, with partial shade, and produce an abundance of showy flowers, which are very valuable for bedding and for cut flowers. The whole plant is more or less hairy.

ZINNIA

(Youth-and-Old-Age)

The zinnia is easily grown from seed sown in the open ground. When sown in April the plants will bloom abundantly and continuously through the entire season. Of late, great improvements have been wrought both to the color and form of the flower. During the month of August zinnias are at their best. To secure large flowers and a profusion of bloom the plants must be given ample room for

Zinnia.

full development, as well as an abundant supply of food. Strong, rich soils suit the zinnia. If the seeds are sown in a dwelling house or in a hotheaded March and the young plants are picked out once or twice before being placed in their permanent situations more satisfactory results will be secured than from outdoor-sown seeds unless equal care in thinning

or transplanting is given. The plants can be used for groups, beds, borders, garden lines, and summer hedges. Their average height is one and one-half feet.

LARKSPUR

(Delphinium)

This is a comparatively rare color among our cultivated plants, and for that reason the delphinium, which shows this color in great variety, is particularly valuable. The brilliant flower-spikes can be seen from a distance and are strikingly effective in beds or masses, in borders, shrubberies, or in combination with white lilies or other plants where a high contrast is desirable. The tall sorts should be planted among shrubbery or used as a background for other low-growing plants whose bloom will produce a pleasing contrast with the larkspur. The dwarf types are better suited for bedding and for low borders. Improvements are continually being made in the size of the flowers, as well as in the length and fullness of the spikes. Some of the species flower both early and late, and the season for all can be prolonged by care in cutting away withered flower-stems as fast as they appear. The delphinium is sometimes increased by division, but like most other plants they are more robust when grown from seed. This plant is easily propagated and adapts itself to many conditions, but in a soil deeply dug and well enriched with

Larkspur.

fine old manure their blooms are large and best. For best results the plants must have ample room to grow; 1 1/2 to 2 feet each way is not too much for the taller sorts.

Annual Varieties.—These include the rocket and hyacinth-flowered larkspur, so called from their long, narrow flower-spikes. They bloom best in a rather cool, moist soil. The seed may be sown in the open border, either in spring or fall, preferably the latter, so that germination may take place very early in the spring. As the seedlings grow, thin them to stand 6 to 8 inches apart, according to variety. The shades of color include light, dark, and azure blue, white, buff, rose, apple blossom, pink, brick red, lilac, violet, and fawn. The varieties are seldom kept separate, as they are quite as pretty and convenient for cutting when sown in mixture. Some of these are really hardy biennials, but because they bloom the first season they are treated as hardy annuals.

Perennial Varieties.—These are usually taller than the annual, requiring more space between the plants. If sown in the autumn or very early in spring many will bloom the first season. The foliage is clean and attractive and the habit of growth strong, producing long flower-spikes.

FOXGLOVE

(Digitalis)

The tall flower-stems of the foxglove are particularly attractive when seen growing among shrubbery or in open places along walks or drives. It is a background for lower-growing

Foxglove.

plants the foxgloves are also very useful and interesting. The spikes are frequently a foot or more in length and thickly strung with many showy, trumpet-shaped flowers. Some of the new sorts rival gladiolus in shadings and colorings.

Plants may be grown from seeds sown in the open in May and the seedlings transplanted where they are to grow in the open or, preferably, to a cold frame, where they make extra strong plants that will flower profusely the next season. They are most satisfactory when treated as biennials, sowing the seed every year in rich, deep soil and partial shade. The average height of the plants is from two to three feet. When the center spike begins to fade it should be cut out and the side shoots will, in consequence, grow more vigorously.

Kidney & Co.

(BY DR. J. H. WATSON)

The kidneys and the skin work in harmony. They're companions, the skin being the second partner. If we are anxious to keep well and preserve the vitality of the kidneys and, also, free the blood from noxious elements, we must pay special attention to a good action of the skin and to see that the kidneys are flushed so as to eliminate the poisons from the blood.

Sweating, by hard work or in a bath, at least once a week, helps to keep the skin and kidneys in good condition. Flush the kidneys by drinking plenty of pure water with meals and between meals. Occasionally obtain at the drug store Anuric, double strength, which will help flush the kidneys and the intestines. You will find that Anuric is many times more active than lithia and that it dissolves uric acid as hot water does sugar.

IS IT A COUGH?

Montrose, W. Va.—"I had a cough every winter for years, but always with the return of warm weather it would leave me, but this particular time even that failed. I was thin, had poor appetite and spent restless nights. A neighbor advised me to use Dr. Pierce's Golden Medical Discovery, so my husband got me a bottle. I left it at my bedside that night and just took a little sip often, and it soon allayed the irritation in my throat and I got some sleep. I continued its use and the change was great, indeed. I began to gain in flesh, my appetite returned and by the time I had completed two or three bottles I was sound and well."
